

Modern Software-Development – Delivering Value, not Code

A comprehensive analysis of your current software development and a guided transition to modern best practices

Software development has seen an unprecedented rate of change. Requirements constantly change, and delivery and validation of new customer value are expected at break-neck speed (aka agile), all the while the team struggles to keep the resulting system complexity at bay. While better tooling, automation and test-driven development have the potential to relieve the team of a lot of the heavy lifting, team organisation and development processes need to change to accommodate such improvements and deliver value and not more just lines of code.

We assist you in evolving your software development processes to match your goals and your organisation; conversely, we advise on and help implement organisational changes to facilitate better collaboration between teams. In an initial workshop, working closely together with your development team, we ensure you receive

- A preliminary analysis of your current software development and technology landscape
- Quick wins to be achieved by making first adjustments
- A well-defined roadmap of actions in terms of technology, team and processes

“To succeed in today’s hyper-competitive world, it is critical that software development follows modern best practices: agile, customer-centric and automated wherever possible.”

Eckart Burgwedel | Senior Enabler, Software Development Expert

Eckart Burgwedel has been leading software companies for 22+ years and supports his clients in building successful software teams who can deliver value at a fast, constant and sustainable pace. → [in](#)
